

Henrik Nilsson, terminologist, terminology teacher, and president of the European Association for Terminology EAFT, presents some aspects of modern terminology management in general, but with links to military terminology management in particular. Challenges, possibilities, and solutions for various phases of terminology management work are presented, e.g. producing convincing arguments for terminology work through cost-benefit analysis and terminology maturity models, creating consensus, and choosing terms following various criteria. The problems of domain loss and the use of AI in terminology work are also mentioned briefly, as is the importance of “trust” in terminology work.
